4
 W/cm^2 are required and crystals must be pure so that the defect concentration is much less than the exciton concentration (10^{15} -- 10^{16} cm^{-3}) at such illuminations. Next, the probabilities are derived of direct IT (allowed and forbidden) from the 1s-state of an exciton of one series to any bound or ionized state of another series. These probabilities are calculated for Cu_2O . For the $1s \rightarrow 1s$ transition from the yellow to the blue series the cross section amounts to $\approx 10^{-13}$ cm^2 . The cross section of the $1s \rightarrow 1s$ transition from the yellow to the blue series the cross section amounts to $\approx 10^{-13}$ cm^2 . The cross section of the $1s \rightarrow n/m$ transition decreases rapidly with increase of the value of n and depends in a complex way on the reduced masses of the initial and final excitons. The cross section for the photoionization of the 1s-exciton may reach $\approx 10^{-15}$ cm^2 in Cds. "The author thanks Prof. A. G. Samoylovich, Prof. A. I. Ansel'm, Prof. V. L. Bonch-Bruevich, and S. I. Moskalenko for criticism and advice." Orig. art. has: 2 tables, and 23 formulas.

TITLE: On the Problem of the Age of East Podolian Cretaceous Deposits (K voprosu o vozraste melovykh otlozheniy vostochnoy Podolii)

PERIODICAL: Dopovidi Akademii nauk Ukrains'koi RSR, 1958, Nr 9,
pp 988 - 991 (USSR)

ABSTRACT: Various investigators, such as G.A. Radkevich [Ref.1], Semiradskiy [Ref.3], R.R. Virzhikivskiy [Ref.4], M.O. Konovalov [Ref.5] and O.V. Savchinskaya [Ref.6], hold different opinions as to the exact age of the Cretaceous deposits of East Podolia. The authors studied the pelecypoda and foraminifera fauna by strata in the area between the Nemia and Zhvan rivers and came to the conclusion that the deposits containing these fossils are of Senoman age, in agreement with the viewpoint of Radkevich. According to the data of A.M. Voloshina [Ref.7], the rich foraminifera fauna is characteristic for the Upper Senoman deposits of the Volyn'-Podolian shield. The vertical distribution of mollusks and foraminifers makes it possible to distinguish the Lower and Upper Senoman substages, but to draw a demarcation line be-

PERIODICAL:

Dopovidi Akademii nauk Ukrains'koi RSR, 1958, Nr 11,
pp 1242-1245 (USSR)

ABSTRACT:

A Study of the foraminifer fauna by layers in the Upper Cre-
taceous deposits of the northern (village of Mokhnachi) and
central (village of Malyye Sorochintsy) parts of the de-
pression, as well as of the northwestern outskirts of the
Donets basin (village of Podvysokoye) made it possible to
define the following stages of the Upper Cretaceous system:
Senoman, Turonian, Coniacian, Santon, Campanian and Maastricht
stages. Microfaunistic horizons, subhorizons and inter-
calations were defined within these stages. The systematiza-
tion of the Turonian-Coniacian deposits according to their
microfauna was carried out by B.M. Keller, N.S. Shatskiy,
and O.R. Konoplina [Ref 2, 1, 3].

There are 3 Soviet references.

TITLE: Peculiarities of the Development of the Basic Structural Elements of the Areas of the Ukrainskaya and Moldavskaya SSRs in Upper Cretaceous Time

PERIODICAL: Dopovidi Akademii Nauk Ukrains'koi RSR, 1959, Nr 6,
pp 651 - 655 (USSR)

ABSTRACT: Apparently without any research work on their own, the authors summarize some data on subject matter, specified in the title, contained in the works of the authors indicated in the reference block, with the following conclusions. The distribution of the thickness and facies of the Upper Cretaceous deposits on the area of the Ukrainskaya SSR indicates the existence in Upper Cretaceous times of areas with various geotectonic conditions. The deposits of that epoch belong mainly to the formations of chalk-like marls, limestones and glauconitic sands and sandstones, which is a good evidence that in remote times the area of the Ukrainian crystalline shield had been covered with the sea. Stable

Card 1/2

SOV/21-59-6-18/27

Peculiarities of the Development of the Basic Structural Elements of the Areas of the Ukrainskaya and Moldavskaya SSRs in Upper Cretaceous Time

subsidence areas include the Dneper-Donets depression, the Galician-Volynian synclise, the Volyn'-Podolian slope of the Ukrainian crystalline shield, the Black Sea depression area, the North-Crimean sag, the Carpathians and the Ciscarpathian sag. The areas where the uplift movements predominated include the Ukrainian crystalline shield and the Donets ridge. The mountainous Crimea, the Cis-Dobruja and the area of Dobruja belong to those areas which had experienced a stable uplift.

There are 1 map and 6 Soviet references.

TITLE: Casting in Non-metallic Molds as a Method for Increasing Labor Productivity (Lit'ye v metallichесkiy formy kak sposob povysheniya proizvoditel'nosti truda)

PERIODICAL: V sb.: Povysheniye proizvoditel'nosti truda v liteynom proiz-ve.
Moscow-Leningrad, Mashgiz, 1955, pp 123-130

ABSTRACT: The author describes the experience of the Leningrad plant im. K. Marx. A description is adduced for molds for pulleys, a counter body, and pistons. The casting temperature of iron is 1300-1340°C; before casting the molds are heated by discharged cast iron to 150-170° and rubbed with a graphite paste consisting of silver graphite with an addition of GTF. The conversion to the preparation of molds from modified low-alloy iron increased their strength by more than 100%. The production of castings is 300 tons per year per worker.

Sverdlov, V. I., Eng.

PURPOSE: The book is intended for workers in trimming departments and should serve to improve their qualification. It may also be useful to foremen and metallurgists in foundries.

COVERAGE: Mechanized methods of trimming and cleaning castings, as well as the equipment used for these purposes, are discussed. The book presents an outline of the technological processes for various types of casting and also

SOV/5275

Lipnitskiy, Abram Markovich

Plavka chuguna i splavov tsvetnykh metallov (Production of Cast Iron and Non-ferrous-Metal Alloys) Moscow, Mashgiz, 1960. 178 p. Errata slip inserted. 7,500 copies printed.

Reviewer: A.I. Gabertsetel', Engineer; Ed.: A.N. Sokolov, Candidate of Technical Sciences; Ed. of Publishing House: T.L. Leykina; Tech. Ed.: A.I. Kontorovich; Managing Ed. for Literature on Machine-Building Technology (Leningrad Department, Mashgiz); Ye.P. Naumov, Engineer.

PURPOSE: This book is intended for cupola and melting-furnace operators and for foremen and process engineers in foundries.

COVERAGE: Information is given on the casting and mechanical properties of cast iron and alloys of nonferrous metals. Also discussed are charge materials, methods of charge computation, melting furnaces, fundamentals of making castings, and labor organization and safety rules for melting shops. No personalities are mentioned. There are 12 references, all Soviet.

TITLE: Assembled Pre-stressed Concrete Segmental Trusses.
(Sborinyye predvaritel'vo napryazhennyye segmentnyye
fermy)

PERIODICAL: Beton i Zhelezobeton, 1958 Nr 4, pp 153-155.

ABSTRACT: Tests carried out on trusses manufactured by the Leningrad Promstroyproyekt and Giprotis showed that the most economical trusses as far as steel and concrete were concerned were those for a span of 18-30m and segmental in shape. The Leningrad Promstroyproyekt in collaboration with the NIIZhB, designed a segmental truss spanning 24m, assembled from two halves. In 1957 the trust Sevuraltyazhstroy manufactured and assembled the above-mentioned trusses in connection with the erection of an alloy factory. Figure 1 illustrates a construction using the segmental truss and Figure 2 consists of details of these trusses which are made from concrete Mark 400. Figure 3 illustrates the reinforcement in a top joint. In the bottom beam 4 channels are formed by using 48mm diameter tubes. The concrete cover of the reinforcement was made 35mm thick due to the presence of obnoxious vapours in these factories. A detailed description of the manufacturing phases in this trust is given. Pre-stressing is

Card 1/2

Assembled Pre-stressed Concrete Segmental Trusses. SOV/97-4-7/11

carried out to the value of $5,700\text{kg/cm}^2$ in the case of the bottom beam and where the steel is Mark 25GS, up to the value of $6,000\text{kg/cm}^2$. Figure 4 illustrates the timber formwork for casting the arched half-truss. For pre-tensioning a 50-ton jack is used, constructed by the Moscow factory imeni Kalinin. The finished half-truss is illustrated at Figure 5. Investigations were carried out to ascertain if mass production could be undertaken and it was found possible. A table gives material requirements for one truss. There are five photographs and one table.

TITLE: Unsteady supersonic flow past blunted bodies with the detached shock wave

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaza, no. 4, 1966, 19-29

TOPIC TAGS: supersonic aerodynamics, unsteady flow, detached shock wave, ~~Newtonian~~,
~~the~~ steady flow, supersonic flow

ABSTRACT: The numerical method of calculating three-dimensional supersonic flows past blunted bodies with detached shock waves developed previously by Telenin and his co-workers is applied here to the case of unsteady flows. The statement of the problem is similar to that presented by the author in a previous article (Izvestia AN SSSR, Mekhanika i mashinostroyeniye, no. 2, 1961) in which supersonic flows past blunted bodies of arbitrary shape with a plane of symmetry and angular oscillations in the plane of symmetry according to the relation $\alpha = \alpha_0 \cos \omega t$ with respect to the average angle of attack β_0 are considered. Thus, the total angle of attack β is expressed by the formula $\beta = \beta_0 + \alpha_0 \cos \omega t$. The solution of the general problem of an unsteady flow is reduced to the integration of a nonlinear system of differential equations describing a steady flow and two interrelated linear systems of partial differential equations with variable coefficients describing disturbances which are in phase with

Card 1/2

L 42891-66

ACC NR: AP6030105

α and α' , with corresponding boundary conditions on the body and shock wave. In the general case, all systems are three-dimensional. Some results from investigating unsteady flows past blunted bodies in the wide range of M_∞ values from 1.5 to ∞ and nondimensional frequencies of the oscillations $\omega L/V_\infty$ from 0 to 1.0, and angles of attack from 0 to 10° are given. A comparison of these results with those obtained by the Newton theory for a sphere shows good agreement for $M_\infty \geq 6$, though for smaller M_∞ , the data obtained by the Newton theory are too low. TITLE: Passing the singular points in numerical solutions of problems on supersonic flows past bodies

SOURCE: Leningrad. Politekhnicheskiy institut. Trudy, no. 248, 1965. Tekhnicheskaya gidrogezodinamika (Technical gas hydrodynamics), 7-1.

TOPIC TAGS: supersonic gas flow, dissociating gas flow, equilibrium gas flow, steady gas flow, unsteady gas flow, shock wave, shock layer, blunt body

ABSTRACT: The parameters of a shock wave are discussed by adapting an approximate method developed by O. M. Belotserkovskiy for the analysis of flows past blunt bodies from the method of integral relations proposed by A. A. Dorodnitsyn. The authors present an approximate system of differential equations which determines the flow parameters across the shock layer and does not contain singular points. The pas-

Card 1/3

L 50380-65

ACCESSION NR: AP5015702

sage through these points is accomplished by using either the extrapolation of velocity derivatives, or the variation of parameters, or the method of continuous calculation. This system, which is very convenient for analysis of nonequilibrium flows, can be integrated with the desired degree of accuracy by conventional methods of numerical integration over the whole shock layer, including the region where the subsonic flow turns into supersonic. This system is supplemented by a system of algebraic equations analogous to the equations describing the transition through the shock wave. The solution of both systems for a perfect gas with a constant heat capacity is outlined, and the treatment of flows in which nonequilibrium dissociation and ionization take place is indicated. Numerous analyses of equilibrium and non-equilibrium flows past blunt bodies of arbitrary shapes have been performed by the proposed method and the results (in the first approximation) for flow parameters are shown in diagrams and are briefly discussed. These parameters include the shape of the shock waves, and the temperature and pressure distributions over the surfaces of segment-shaped bodies and of a spherical segment in a flow of nonequi-

PHASE I

TREASURE ISLAND BIBLIOGRAPHICAL REPORT

AID 379 - I

BOOK

Authors: LIPOV, P. P. and TSITSIN, M. A. Call No.: AF-France 1953
Full Title: HANDBOOK FOR MECHANICS OF ORE-MINING INSTALLATIONS
Transliterated Title: Spravochnik mekhanika gornorudnykh predpriyatiy

Publishing Data

Originating Agency: None
Publishing House: State Scientific and Technical Publishing House
of Literature on Ferrous and Non-Ferrous Metals
Date: 1953 No. pp.: 1076 No. of copies: 13,000
Editorial Staff
Editor: None Tech. Ed.: None
Editor-in-Chief: None Appraiser: None
Others: A list of 16 names of those who took part in the editorial work is given

Text Data

Coverage: This handbook contains technical data and characteristics on equipment used in ore-mining enterprises, directions for its choice and its calculation, and also information on its operation and repair. The information, data and instructions appearing in this book were compiled taking into account existing standards and operation and safety rules. Diagrams, graphs, tables, etc.

Spravochnik mekhanika gornorudnykh predpriyatiy

AID 379 - I

This is a well-compiled handbook.

TABLE OF CONTENTS

Preface

PART I Section I Drilling

Chapters: 1. Methods of drilling blast holes and wells; 2. Percussion mechanical drilling of blast holes; 3. Rotary drilling; 4. Percussion cable drilling of deep wells; 5. Preparation and dressing of boring bits; 6. Preparation and dressing of drills. Bibliography for Section I.

Section II Excavators and Loading Machines

Chapters: 7. One-shovel excavators; 8. Loading machines.

57-94

Bibliography for Section II.

Section III Transportation

Chapters: 9. Conveyers; 10. Scraping installations; 11. Haulage on narrow gauge roads; 12. Electric locomotive haulage; 13. Transport on normal gauge railroad; 14. Ground-moving road machines; 15. Suspended cableways; 16. Hydro-transportation, hydromechanization. Bibliography for Section III.

Section IV Mine Elevators

Chapter: 17. Mine elevator installations. Bibliography for Section IV.

187-240
